SIMATS ENGINEERING
CO1 - ASSESSMENT TOOL 1

COURSE NAME: Deep Learning COURSE CODE: MLA0403

Name of the Student	**P. Hithaishi**
Reg. No	**192425196**

COURSE OUTCOME COVERED

CO1: Learning Algorithms, Maximum Likelihood Estimation (MLE), Building Machine Learning Algorithms, Neural Networks, Artificial Neurons, Perceptron, Multilayer Perceptron (MLP), Forward Propagation, Backpropagation Algorithm, Gradient Descent, Stochastic Gradient Descent (SGD), Mini-Batch Gradient Descent, Curse of Dimensionality. (BL3)

CO1 Weightage: 15% Assessment Tool Weightage: 35% Duration: 1 Hour Marks: 50

QUESTIONS: 5

Duration: 1 Hour
Total Marks:50

Annexure A

Analytical Problem Solving

1. A coin is tossed 10 times and the outcomes are:

   H H T H H H T H H T
   Using Maximum Likelihood Estimation, estimate the probability of getting Heads (p).
   Given outcomes:
   H H T H H H T H H T Answer

- Total tosses (n) = 10
- Number of Heads (H) = 7

   MLE formula:

$$\hat{p} = \frac{\text{Number of Heads}}{\text{Total Tosses}}$$

$$\hat{p} = \frac{7}{10} = 0.7$$

   Answer: $p = 0.7$

2. Out of 50 students, 42 passed an exam.

Assuming a Bernoulli distribution, find the MLE of the probability that a student passes. **Answer:**

students Passing Exam

- Total students = 50
- Passed = 42 MLE:

$$\hat{p} = \frac{42}{50} = 0.84$$

Probability of passing = 0.84

3. A factory produces light bulbs. In a sample of 100 bulbs, 8 are defective.

Find the MLE for the probability that a bulb is defective **Answer**.

Defective Light Bulbs

- Total bulbs = 100
- Defective bulbs = 8 MLE:

$$\hat{p} = \frac{8}{100} = 0.08$$

Probability of a bulb being defective = 0.08

4. A biased die is rolled 60 times. The number 6 appears 18 times.

Estimate the probability of rolling a 6 using MLE.

Answer Biased Die

- Total rolls = 60
- Number of sixes = 18 MLE:

$$\hat{p} = \frac{18}{60} = 0.30$$

Probability of rolling a 6 = 0.30

5. Given:

Input (x) = 4

Weight (w) = 2

Actual Output = 10

Prediction: y = w × x

1. Find the predicted output.
2. Calculate the error.
3. If the gradient is 4 and learning rate is 0.01, find the updated weight.

1) Predicted Output

$$y = w \times x = 2 \times 4 = 8$$

Predicted Output = 8

(2) Error

$$\text{Error} = \text{Actual Output} - \text{Predicted Output}$$
$$= 10 - 8 = 2$$

Error = 2

(3) Updated Weight Gradient
Descent Formula:

$$w_{\text{new}} = w - \eta \times \text{Gradient}$$

where

-
- $\eta = 0.01$
- Gradient = 4

$$w_{\text{new}} = 2 - (0.01 \times 4)$$
$$= 2 - 0.04 = 1.96$$

Updated Weight = 1.96

RUBRICS FOR CALCULATION

Criteria	Weightage	Level 4 – Exemplary (5 Marks)	Level 3 – Proficient (4 Marks)	Level 2 – Developing (2–3 Marks)	Level 1 – Beginning (0–1 Mark)
Problem Understanding	20%	Clearly interprets problem, identifies all parameters and requirements accurately	Understands problem with minor gaps	Partial understanding; misses key elements	Misinterprets or unable to understand problem
Method Selection	20%	Selects most appropriate method/formula with strong justification	Selects correct method with minor errors	Inappropriate or partially correct method	Unable to select method
Solution Process	25%	Logical, systematic steps with correct approach throughout	Mostly correct steps with minor mistakes	Disorganized steps; multiple errors	No clear process
Accuracy of Calculation	20%	All calculations accurate; correct final answer	Minor calculation errors	Frequent errors; incorrect final answer	No valid calculations
Interpretation of Results	15%	Clearly interprets results with units and engineering relevance	Basic interpretation with minor omissions	Limited or unclear interpretation	No interpretation
